

SearchRowForText Function

Search a row in worksheet for matching text.

Syntax

Rpm.**SearchRowForText**(*intSheet*, *intRow*, *strText*)

Example

Rpm.SearchRowForText(1, 1, "1X")

Sheet 1 row 1 is searched for the text "1X". The column containing the first occurrence of the text is returned.

Input

intSheetr – worksheet (integer, required).

intRow – Row number(integer, required)

strText – Search text(string, required)

Return

The sheet and row is searched for the specified text. The row is searched starting from the left (column A) towards the right (column b, c, etc). The search will stop when the first occurrence of the text is found (note: matching criteria is not case sensitive). The column identifying the location of the text is returned (string). If no match is found then "" is returned.
