

AvailableRows Function

Retrieve the number of available rows in a worksheet. This value is computed by subtracting the total number of rows from the number of masked rows (header rows).

Syntax

Rpm.**AvailableRows**(*intSheet*)

Example

Rpm.AvailableRows(1)

Retrieve the available number of rows in sheet 1.

Input

intSheet – worksheet (integer, required).

Return

The available number of rows in the specified worksheet (long) is returned. This value is computed as the total number of rows minus the masked rows.
